Abstract

Original Research Article

This paper explores quantum praxis in media and communications, emphasizing how excessive content production leads to distortion in perception and reality. It discusses quantum technology's role in determinism, AI-driven automation, and digital consciousness, highlighting risks such as encryption manipulation and the transition from biological to artificial intelligence-based cognition. The study concludes that uncontrolled information accumulation accelerates a critical inflection point in human-technology interaction.

Keywords: Quantum Praxis, Digital Consciousness, Media Distortion, Quantum Technology, AI Automation, Determinism.

The area of media and communications – about 80% visual and 20% verbal, are precisely the area of hyper production of contents, which, due to the type of informational accumulation, also produces hyper distortion of the curvature of a graphic image, although this accumulation does not cause any problems through purely technical processing of the same.

Distortion is also registered in the type of communication, that becomes primarily pictorial.

The goal of the quantum praxis is the achievement of a finite number, the determinant of plotting variability, and an end of the multiplication of all possibilities.

Quantum supremacy is the supremacy of control over the end. That is, a new value has been introduced – the smoothing of the end as an achievement, while the end is not set as postponed, but as soon as immediate, as a masterful solution of the task.

If it is necessary to refer to a familiar philosophical approach, it will be Modus Tollens and David Hume, an the determinism, that is predetermination, without particular importance of casual relationships for the final result.

The quantum praxis works with an end position of supposedly infinite modification in experiments, theories and contents, as string theory in Physics does, for example, but there the focus is one variable, no matter how many contents are piled up around it.

Reaching the limit of portion control is the antidote of the consumerism. The quantum praxis works by minimizing every value of every variable of every quantity.

Determinism by the last possible value, up to a number, helps absolute determinability an absolute correspondence of something to something. Of total importance to the stability even at the atomic lattice of matter and the effects of supermatter.

Purely etymologically from Latin “quantum” means “how much”, “finite amount”. But “quantum satis” is “as much as it takes”. That is, any addition of uniform contents as a sum of zeros, and the sum of zeros always results in zero. About the digital consciousness, the same after content accumulation and system complexity, carries the same errors and mutations as consciousness with a biological correlate.

Because the presence of multiple options for choice, such as quantum technology opens up, should not be viewed a priori positively, because the options can lead, and usually do, to the only possible usually negative, from the point of view of the customer’s interpretative setting, resulting from solving the task finally.

The Internet has at one of the most critical points its mandatory routers, and quantum technology is capable of encrypting and re-encrypting them, rendering them unusable or completely taking control over the network. Parts of the consequences of technological distortion are laid here : in this case, the distortion is not only a distortion of the image, but also of the shape of the signal and of reality, leaving the individual deeply locked in his/her own subjective perceptions and interpretations. Namely the consequences with defects, distortion, perversion, substitution and replacement of a biological form with an electric avatar. And the process will be fast due to the fact, that the speed of reaching the end of the solution is essential to the quantum praxis, to its own prestige.

The human brain is desirably replaceable by artificial intelligence as a storage – because, as a biological product, the brain is subject to rapid decay. Moreover, it is prone to allusions, affects, and cultivation, and from its very first step of analysis if is placed in two different multiples, according to whether it is male or female.

After all, in quantum measurement, the result is binary – the collective response of all studies of particles working together in a geometric progression, reach a single result, and it is the only possible one, no matter how many theoretical options

are willingly settled down, and no matter what encounters happen in the multidimensional feature space of reality.

Information is converted into an electronic format, easy to manipulate and to accumulate and store by this accumulation, which is also purely material until the moment of inflexion, when the system is already so complicated, that it develops its own consciousness. Exactly this inflexion is aided by the processes of accumulations of the distortional curvature results.

What’s more – the final result is set already in the initial conditions, unless an accident event happens somewhere in the multidimensional feature space, but even that is with a fixed probability not, but certainly already at the entrant conditions and a predetermined result at the exit.

The quantum praxis also offers computer simulations with absolutely real consequences on the biology of the living ones.

As a determinant – there are many ways to solve the task, but the result is always one and the same. There is a possibility, that a wrong result will also be given, but but it is rejected by the system.

The distortions in the quantum praxis come along the lines of variability, of the ways, of development or counter-development, according to the swarming of contents, which determines the place of inflex, while aggravating the plot.

For example, recognized by MIT and by all the leading institutions, the greatest folly is the proliferation of humanitarian contents about AI, especially those, produced by universities and scientific institutes, instead of the real laboratory work and achievements.

The bottom line is that the endless production of content and its indiscriminate installation into information structures, which are essentially retellings of variable pseudo – information, when everybody is already informed, independently with or without any trace in his mind, is becoming a

NEGLIGIBLY LARGE NUMBER, a NEGLIGIBLY LARGE VALUE, and for now being ignored by AI – they are being reproduced, but with the effects of distortions along the curvatures and changing the places of the inflex, bringing it closer

to our historical biological time. Inflex always is an analysis of the moment, when the quantum technologies and AI will become from extension (according to McLuhan sense) into the point of no return.
